Practical Examples of Dragnet Solution in Numerical Reasoning

Example 1: Percentage Problem

Question:

A shop sold 120 units of a product at a profit of 20%. If the cost price per unit is Rs. 50, what was the total selling price?

Solution Using Dragnet Approach:

- Step 1: Understand data:
 - Cost price per unit = Rs. 50
 - Profit = 20%
 - Units sold = 120
- Step 2: Calculate selling price per unit:
 - Profit per unit = 20% of Rs. 50 = $0.20 \times 50 = \text{Rs. } 10$
 - Selling price per unit = Rs. 50 + Rs. 10 = Rs. 60
- Step 3: Calculate total selling price:
 - Total = Rs. 60 $\times$ 120 = Rs. 7200
- Final Answer: Rs. 7200

This example demonstrates the systematic breakdown?considering profit percentage, unit cost, and total units?to arrive at the solution efficiently.

Example 2: Data Interpretation

Question:

The following table shows the sales of five products over a month:

Product	Units Sold	Price per Unit (Rs.)
A	150	20
B	200	15
C	100	25
D	180	22
E	120	18

Find the total revenue generated from all products.

Solution Using Dragnet Approach:

- Step 1: Calculate revenue for each product:
 - Product A: $150 \times 20 = \text{Rs. } 3000$
 - Product B: $200 \times 15 = \text{Rs. } 3000$
 - Product C: $100 \times 25 = \text{Rs. } 2500$
 - Product D: $180 \times 22 = \text{Rs. } 3960$
 - Product E: $120 \times 18 = \text{Rs. } 2160$
- Step 2: Sum all revenues:
 - $\text{Rs. } 3000 + \text{Rs. } 3000 + \text{Rs. } 2500 + \text{Rs. } 3960 + \text{Rs. } 2160 = \text{Rs. } 14620$
- Final Answer: Rs. 14620

By systematically calculating each component, the dragnet solution ensures accuracy and clarity.

Step-by-Step Guide to Dragnet Solution Numerical Reasoning

Let's explore a detailed approach with an example to illustrate how to implement dragnet solutions effectively.

Example Problem:

In a company, the number of employees increased by 20% last year. If the current number of employees is 720, what was the number of employees two years ago?

Step 1: Understand the Question

You're asked to find the original number of employees two years ago, given the current number and the percentage increase over the last year.

Step 2: Identify Relevant Data

- Current employees = 720
- Percentage increase last year = 20%
- Time frame: Two years ago

Step 3: Break Down the Problem

- First, determine the number of employees after the 20% increase last year.
- Then, understand the growth over the two-year span.

Step 4: Reverse the Percentage Increase

Since the current number (720) reflects a 20% increase over the previous year, you can find the number of employees after the first year (i.e., at the end of last year):

Employees after 1 year = Current employees / (1 + percentage increase)

Expressed mathematically:

Employees after 1 year = $720 / 1.20 = 600$

Step 5: Understand Growth Over Two Years

The problem asks for the number of employees two years ago. Assuming the same percentage increase applies each year:

- Let the number of employees two years ago = x
- After one year: $x (1 + 20\%) = x 1.20$
- After two years: $x (1.20)^2$

We know after two years, the number of employees is 600 (from Step 4), so:

$$x (1.20)^2 = 600$$

Step 6: Solve for x

Calculate:

$$x = 600 / (1.20)^2$$

$$x = 600 / 1.44 \approx 416.67$$

Answer: Approximately 417 employees were there two years ago.
